HCS STREETS

Designed at the request of the Office of Construction Management, HCS Streets provides school users to lookup school attendance zones based on an easy to use address search function. Using HCS Streets, users can quickly find the answer to the question, “which school will my child be attending if I live at the following address?”

Working in conjunction with the Office of Construction Management, HCS Streets provides the functionality for the OCM to upload country provided street and address information to be stored in the HCS Streets database. This information is then used to display address and school attendance zones to schools.

Further, HCS Streets provides an intelligent search capability offering up spelling suggestions based on user requests. This allows users to easily find the streets that they are looking for without having to know exactly what the name of the street is.

HCS Streets provides an excellent, easy to use tool for schools and the OCM to find school zones based on address, and the project still has room to grow.
